NOTIFICATION OF TRANSMITTAL OF THE INTERNATIONAL PRELIMINARY **EXAMINATION REPORT**

(PCT Rule 71.1)

Date of mailing

(day/month/year)

13.05.2004

Applicant's or agent's file reference

AWP/P60449/001

PCT/GB 03/03301

IMPORTANT NOTIFICATION

International application No.

International filing date (day/month/year) 30.07.2003

Priority date (day/month/year)

30.07.2002

Applicant

LOTUS CARS LIMITED et al.

- 1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
- 2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

The applicant's attention is drawn to Article 33(5), which provides that the criteria of novelty, inventive step and industrial applicability described in Article 33(2) to (4) merely serve the purposes of international preliminary examination and that "any Contracting State may apply additional or different criteria for the purposes of deciding whether, in that State, the claimed inventions is patentable or not" (see also Article 27(5)). Such additional criteria may relate, for example, to exemptions from patentability, requirements for enabling disclosure, clarity and support for the claims.

Re Item V

D1: GB-A-1 324 456

D2: US-A-2 630 136 (not cited in search report)

D3: US-A-5 881 689

Novelty

D1 discloses an electrically operated valve for controlling flow of hydraulic fluid comprising

a valve housing 1

a spool 4 slidable in a spool chamber in the valve housing

a first (such as left side conduit 3 on fig.1), second (such as right conduit 3 on fig.1) conduits extending through the valve housing and suitable for connecting the spool chamber with any apparatus to which it might be connected,

a third conduit 2 in communication with the spool chamber and suitable for delivering to or receive fluid from any apparatus, provided it is connected thereto

the spool is biased to a rest position (Fig.1) by a pair of opposed springs 7 the spool in the rest position closes off the first and second fluid conduits 3,3 from the spool chamber and thereby prevent flow of fluid to or from the third fluid conduit 2 the valve has a first electric coil A associated with a first end of the spool and a second electric coil A associated with a second end of the spool

whereby the first electric coil can be activated to displace (towards left on fig.1) the spool from the rest position thereof to open the first fluid conduit to the spool chamber and thereby to allow fluid communication between first and third conduits through the spool chamber;

in this position however, the second fluid conduit is not kept closed, as required by present claim 1

and whereby the second electric coil can be activated to displace (towards right on fig.1) the spool from the rest position thereof to open the second fluid conduit to the spool chamber and thereby to allow fluid communication between third and second conduits through the spool chamber;

in this position however, the first fluid conduit is not kept closed, as required by present claim 1.

The same comments apply equally to document **D2**, not cited in the search report: this documents sets out the use of the valve for a double acting device (column 2, lines 38) and the fact that the spool is biased in a centered position (shown on figure 1) by opposed springs 48, and when it leaves this rest position under the actuating

EXAMINATION REPORT - SEPARATE SHEET

electromagnetic force of a coil 70, it provides communication of either first conduit 13 or second conduit 15 with the central -third- conduit 16, whereby however the other of the first and second conduit is then not kept closed (column 6, lines 24-36).

The subject-matter of claim 1 thus differs from this prior art in that when the first conduit is opened and communicates with the third conduit, the second conduit remains closed and in that when the second conduit is opened and communicates with the third conduit, the first conduit remains closed.

D3 discloses an engine valve operated by a pressurized fluid through an electrically operated valve 6; this valve 6 has a spool slidable in a spool chamber and three conduits 7,16 and 10 in its housing, a first one 7 for connecting the spool valve chamber with a source of pressurised fluid, a second one 16 for connecting the spool chamber with a reservoir of fluid, a third one 10 in communication with the spool chamber an which delivers fluid to or receives fluid from the upper work space 3. This spool however is not biased to a rest position by a pair of opposed springs and it is not actuated by electric oils but rather through fluid pressure. There is also no rest position in which both conduits 7 and 16 would both be closed: the spool rather takes two different positions permitting communication of the working chamber 3 through port 10 either with the pressure line through port 7 or with the return line through port 16.

The object of claim 1 is thus novel over this prior art.

The independent method claim 6 being a method of operating the electrically operated valve of claim 1, it requires this valve as part of the method and is therefore also novel. The independent claim 7 being a system including the valve of claim 1 is also novel.

The claims 1-8 fulfil the requirements of novelty in accordance with Art.33(2) PCT.

Inventive step

The valve of D1 appears to be rather designed, with its central inlet port 2 and on both sides of this inlet ports respective outlet ports 3, for use with a double acting cylinder. Should a skilled person wish to adapt the valve of D1 so that it is suitable for controlling in- and out-flow to and from a single working chamber, the teaching of D2 could be considered. In this case, the central port could be connected to the working chamber and the respective ports 3 could be connected to the inlet (such as port 7 o D2) and to the return line (such as port 16 of D2).

The spool however would then, along the teaching of D2, no longer be adapted for having a rest position in which both the first and the second conduits are both closed.

INTERNATIONAL PRELIMINARY

International application No.

PCT/GB 03/03301

EXAMINATION REPORT - SEPARATE SHEET

but rather would be adapted to take only two positions, these positions communicating the working chamber either to the pressure port or to the return line.

The features of claim 1 and thus also of the independent claims 6 and 7, cannot be derived without ex-post facto consideration from the available prior art.

The claims 1-8 fulfil the requirements of inventive step in accordance with Art.33(3) PCT.

Industrial application

A valve in accordance with claims 1-5, a method in accordance with claim 6 or a system in accordance with claims 7 and 8 are obviously industrially applicable.
